#### Workshop organization

- Session Goal
- Toolchain setup
  - Software configuration
  - Hardware setup
- Proof Of Concept

#### **Session Goal**

# Adapt a USB Low Speed HID device to a Bluetooth HID device

- ➤ Get the USB HID reports on the ESP32
- Decode the HID reports into structured data
- Emulate a BLE HID device with the ESP32

- Wireshark
  - https://www.wireshark.org/download.html
- Install USBPcap when asked by the setup

- Arduino IDE
  - https://www.arduino.cc/en/software

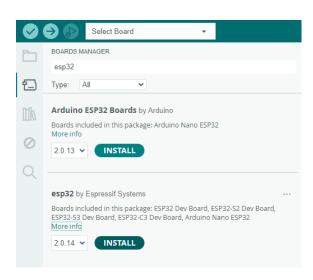

#### ESP32 support in Arduino IDE

- File → Preferences
- Add to "Additional boards manager":
  - https://raw.githubusercontent.com/espressif/arduino-esp32/gh-pages/package\_esp32\_index.json
- Boards
- Search for "esp32"
- Install "esp32 by Espressif"

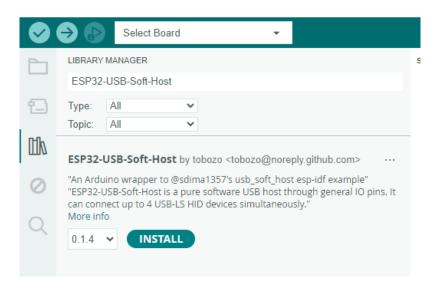

#### ESP32 USB Host Library

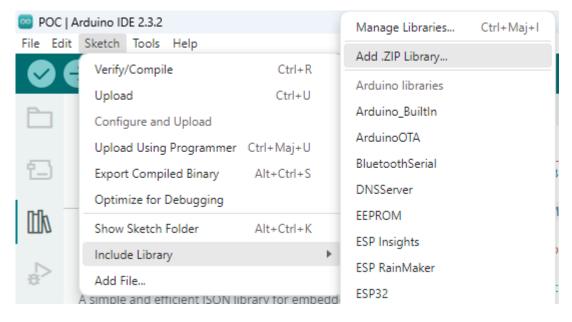

- Library Manager
- Search for "ESP32-USB-Soft-Host"
- Install "ESP32-USB-Soft-Host by tobozo"

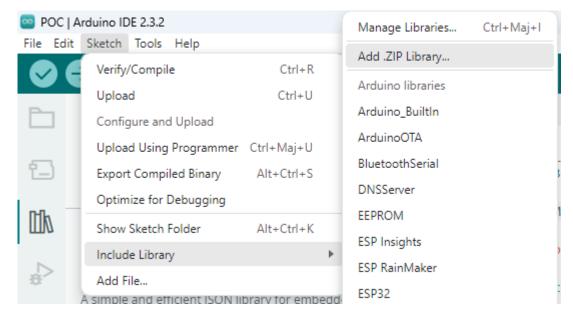

- ESP BLE Keyboard library
  - https://github.com/T-vK/ESP32-BLE-Keyboard
  - Download library as a ZIP archive
  - Install it through the Arduino IDE

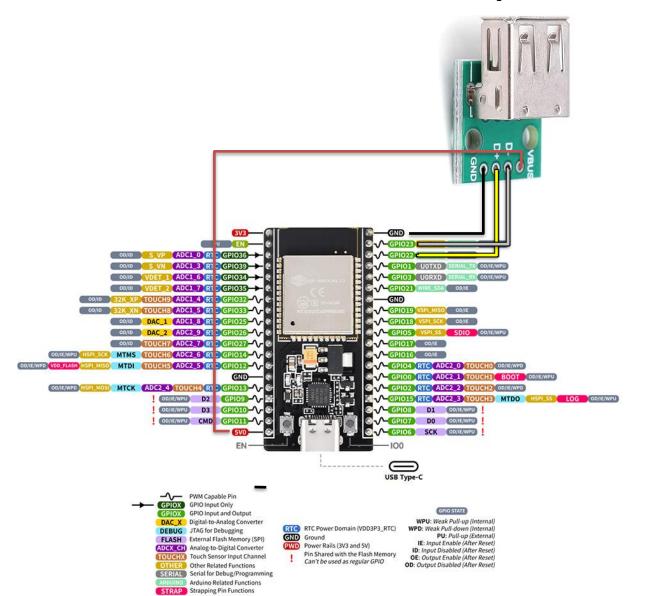

- ESP BLE Mouse library
  - https://github.com/T-vK/ESP32-BLE-Mouse
  - Download library as a ZIP archive
  - Install it through the Arduino IDE

#### Hardware setup

# SCIENCES ET TECHNOLOGIES ÉCOLE D'INGÉNIEURS

#### Getting reports on the ESP32

- Use the USB\_Test example from ESP32-USB-Soft-Host library to get descriptors and raw data
- Notice my\_USB\_PrintCB: a callback function that is called on each received HID report.

```
static void my_USB_PrintCB(uint8_t usbNum, uint8_t byte_depth, uint8_t* data, uint8_t data_len)
{
   // if( myListenUSBPort != usbNum ) return;
   printf("in: ");
   for(int k=0;k<data_len;k++) {
        printf("0x%02x ", data[k] );
    }
   printf("\n");
}</pre>
```

## Getting reports on the ESP32

 After compiling and uploading, you should then receive the descriptors and the raw data from the device on the serial terminal.

```
in: 0x01 0x02 0x00 0x00 in: 0x01 0x01 0x00 0x00 in: 0x01 0x01 0xff 0x00 in: 0x01 0x01 0xff 0x00 in: 0x01 0x01 0x00 0x00
```

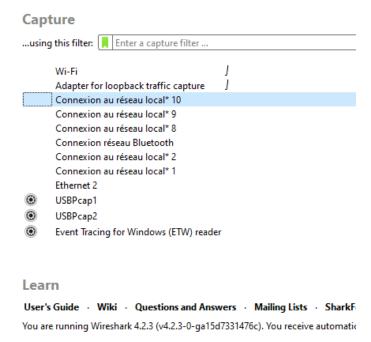

**≻**How to interpret the data?

### **Decoding HID reports**

- We need the report descriptor!
  - Use Wireshark to sniff on the USB enumeration
  - Select USBPcap interface

#### Decoding HID reports

- How to get the report descriptor?
  - Plug in your USB device into the Extract HID Descriptor
  - Check for the GET\_DESCRIPTOR Response

```
2... 14823.40... host
                                2.11.0
                                               USB...
                                                      36 GET DESCRIPTOR Request HID Report
   2... 14823.40... 2.11.0
                               host
                                               USB...
                                                      90 GET DESCRIPTOR Response HID Report
                                2.11.1
   2... 14823.41... host
                                               USB
                                                       27 URB_INTERRUPT in

```

#### Decoding HID reports

- Compare the reports given by the esp32 with the report descriptor
  - Check <a href="https://docs.kernel.org/hid/hidintro.html">https://docs.kernel.org/hid/hidintro.html</a> for help understanding the report

> Write a structure typedef that matches this report format

#### **Emulating BLE HID device**

- We'll use the following libraries:
  - https://github.com/T-vK/ESP32-BLE-Mouse
  - https://github.com/T-vK/ESP32-BLE-Keyboard
- Once installed, checkout the example codes
  - MouseButtons
  - SendKeyStrokes
- > Integrate everything into a single code that
  - Uses the USB host library to get reports from your HID device
  - Formats the data into a structure
  - Uses the structure to send BLE HID data

#### **Emulating BLE HID device**

#### Important!

 When integrating USB Host and BLE into the same code, this should be added in the code **before** the USB Host initialization!

```
// necessary for USB to work with BLE
USH.setISRAllocFlag(NULL);
USH.init(USB_Pins_Config);
```

BLE library has to begin after the USB initialization!

```
// has to begin AFTER USB host
bleMouse.begin();
```

#### **Emulating BLE HID device**

 Example for BleMouse, use the class functions to translate the HID report structure into BLE actions

```
void click(uint8_t b = MOUSE_LEFT);
void move(signed char x, signed char y, signed char wheel = 0,
signed char hWheel = 0);
void press(uint8_t b = MOUSE_LEFT); // press LEFT by default
void release(uint8_t b = MOUSE_LEFT); // release LEFT by default
bool isPressed(uint8_t b = MOUSE_LEFT); // check LEFT by default
bool isConnected(void);
void setBatteryLevel(uint8_t level);
```
